Black smoke coming out of your car's exhaust pipe could be another indication that your car's coolant temperature sensor is faulty or failing. Here's what happens: Faulty readings from the coolant temperature sensor can cause the engine to miscalculate the air-fuel mix in the engine.

4 Signs Your Coolant Temperature Sensor is Faulty

The signal from the coolant temperature sensor tells the engine's computer when to apply extra gasoline during a cold start. A faulty sensor can confuse the computer, keeping it from providing enough fuel. As a result, the engine may hesitate or stall. 3.

Signs Your Engine Coolant Temperature (ECT) Sensor Is Bad

Another symptom of a problem with the coolant temperature sensor is an overheating engine. The coolant temperature sensor can also fail in a manner that causes it to send a permanently hot signal. This can cause the computer to incorrectly compensate for a lean signal, which can result in overheating, and even misfires or engine ping. 4.

Symptoms of a Bad or Failing Coolant Temperature Switch ...

Your symptoms are a dead ringer for a bad engine coolant temperature sensor (ECT). The computer is calculating an air/fuel mixture that is too lean. That's why pumping the gas pedal keeps your engine running. You can have a bad sensor even without a "check engine" light or trouble code.
